Today:
  o Quiz 1
  o More logic
  - Finish propositional calculus: Formal proofs, and some without-proof theorems
  - First-order logic (adding quantifiers) (didn’t get to this)

Propositional Logic “Propositional Logic” = “Sentential Logic” = “Sentential Calculus”

Review: WFFs
  truth tables
  truth assignments
  logical completeness
  DNF
  satisfiability
  tautology $\models \phi$
  is logically equivalent

A formula $\phi$ is **satisfiable** if some t.a. makes it true.
A set of formula $\Gamma$ is **satisfiable** if some t.a. makes them all true.
A formula $\phi$ of propositional logic is **tautological** (or **valid**) if it is true for every t.a.
$\models \phi$ (It is satisfiable if it is true under some t.a.)

Formulas $\phi$ and $\psi$ are **logically equivalent**, written $\phi \equiv \psi$, if $\phi \leftrightarrow \psi$ a tautology.

**Prop**: There is an algorithm (=a precisely-describable procedure, mechanism, recipe) that, given a WFF of sentential logic, decides
  - if it is a tautology.
  - if it is a satisfiable.
  - if it is equivalent to some given, second formula. $f \models =| g$

Some simple tautologies Velleman, List from How to Prove It, p. 21, 23, 47, 49.
You can check any of these with a truth table.

**Associative**: $P \land (Q \land R) \equiv (P \land Q) \land R$  //Mention the similarities to arithmetic
$P \lor (Q \lor R) \equiv (P \lor Q) \lor R$  //laws with $\lor$ corresponding to **addition**
//and $\land$ corresponding to **multiplication**

**DeMorgan’s**: $\neg (P \land Q) \equiv \neg P \lor \neg Q$
$\neg (P \lor Q) \equiv \neg P \land \neg Q$

**Idempotent**: $P$ and $P \equiv P$
$P \lor P \equiv P$

**Contradiction** $P \rightarrow Q \equiv \neg P \lor Q$
$P \rightarrow Q \equiv \neg (P \land \neg Q)$

**Formal Proofs**
Discuss conventional proofs vs. formal proofs.

I now discuss formal proofs, although what mathematicians – and you – will mostly be producing conventional (informal) ones. Following from Wikipedia, *Propositional Calculus*. Following 14 rules

### Axiom List W

One of the reasons to have a list of axioms like the list just given is to develop a notion of “what is provable” We will write $X \vdash Y$ if statement $Y$ follows from $X$. Read: $Y$ is provable from $X$. **Turnstyle** is the name of the symbol.

**Formal proofs** are quite different from **conventional proofs**, but a **thesis** in mathematics is that conventional proofs can be recast as formal ones. What are formal proof? They are syntactic objects in some formalized system. There are many choices one has in how to do the formulation,
but here is what we would typically have: that a formal proof is a sequence of formula: $\phi_1, ..., \phi_n$
where each $\phi_i$ is either

1. an **assumption** or
2. an **axiom** (it appear on a list like Axiom List W) or
3. it follows from a previous set of lines in the proof by one of a number of enumerated rules –
   indeed we can make do with one rule, modes ponens,
   i) $(A \rightarrow B)$
   ...
   j) $A$
   ...
   k) $B$  *modes ponens*

if $\phi_1, ..., \phi_n$ are the assumptions used in a proof and $\phi$ is a statement in the proof then we write
$\phi_1, ..., \phi_n \vdash \phi$  to indicate that  $\phi$  can be proven from $\phi_1, ..., \phi_n$

**Definition:** if   
$\{ \phi_1, ..., \phi_n \} \vdash \phi$  then  $(\phi_1, ..., \phi_n) \vdash \phi$

**Example:**
$\vdash (PQ)(P \lor R \rightarrow S)(SQ \rightarrow T) \rightarrow T$

1. $PQ$  assumption
2. $P \lor R \rightarrow S$  assumption
3. $SQ \rightarrow T$  assumption
4. $P$  "conjunction elimination"  $(P \land Q \Rightarrow P)$  applied to (1)
5. $Q$  "conjunction elimination"  $(P \land Q \Rightarrow Q)$  applied to (1)
6. $P \lor R$  "disjunction introduction"  $(P \lor R \Rightarrow S)$  applied to (5)
7. $S$  modus ponens  $(A \rightarrow B \ A \text{ gives } B)$  applied to (2) and (6)
8. $SQ$  "conjunction introduction"  $(S, Q \Rightarrow SQ)$  applied to (7) and (5)
9. $T$  modus ponens applied to (3) and (8)

therefore

$\{ PQ, P \lor R \rightarrow S, SQ \rightarrow T \} \vdash T$   //The given statement is provable

$\vdash \phi$  can derive (prove) $\phi$  (from the $\emptyset$  — no assumptions)
$\Gamma \vdash \phi$  can derive $\phi$  from $\Gamma$

**Some theorem and terms: Completeness, Soundness, and Compactness of Predicate Calculus**

**SOUNDNESS:**  $\Gamma \vdash \phi \Rightarrow \Gamma \models \phi$

**COMPLETENESS:**  $\Gamma \models \phi \Rightarrow \Gamma \vdash \phi$

**COMPACTNESS:**  Let $\Gamma$  be a set of WFFs.
Suppose that *every finite subset* of $\Gamma$  is satisfiable.
Then $\Gamma$ is satisfiable.

(contrapositive:
Let $\Gamma$ be a set of WFFs.
If $\Gamma$ is unsatisfiable then some finite subset of $\Gamma$ is too)

Don't prove -- want to use this in a computer-science example.

Application: TILING (Dominos)
Can you tile the with tiles of specified types
(adjacent edges of the same color)

Eg:

Make an example where the plane is and is not tileable. Indicate that, in ecs120, common to prove that the TILING decision question is undecidable. But not our interest here. We are interested in whether the tileability of the plane for a given set of tile types is FALSIFIABLE -- is there a proof of untileability? There will be if the following is true:

If the plane is untellable, it is already untileable on some finite subset of the plane.

Not an obvious claim -- a priori possible that plane is untileable even though every finite rectangle of it is tileable.

To prove from compactness:

Introduce a variable
\[ P[i,j,k]: \text{there is a tile of type } k \text{ at position } (i,j) \]

Write a boolean formula to capture
- One and only one tile per cell: $P[i,j,k] \rightarrow \neg P[i,j,k']$ for all $i,j$ and all $k \neq k'$.
- Adjoining tiles are of compatible types. $P[i,j,k] \rightarrow (\lor k' P[i+1,j,k'])$, for all $i,j$, if a tile of type $k'$ can be put atop a tile of type $k$; and so on (three more sets of rules)

Now: connect it to compactness theorem. The set $\Gamma$ is all the formulas above. If it is unsatisfiable, then some finite subset of $\Gamma_0$ is unsatisfiable. Let $n$ be the largest index used by a variable in $\Gamma_0$. Then the $[-n.n] \times [-n.n]$ subset of the plane is already untileable.

Gamma is satisfiable iff every the plane can be tiled with tiles of the given types.

In the language you will learn in ecs120, TILING is co-RE
