Outline

[read Chapter 2]
[suggested exercises 2.2, 2.3, 2.4, 2.6]

• Learning from examples
• General-to-specific ordering over hypotheses
• Version spaces and candidate elimination algorithm
• Picking new examples
• The need for inductive bias

Note: simple approach assuming no noise, illustrates key concepts
Training Examples for EnjoySport

<table>

What is the general concept?
Representing Hypotheses

Many possible representations

Here, $h$ is conjunction of constraints on attributes

Each constraint can be

- a specific value (e.g., $Water = Warm$)
- don’t care (e.g., “$Water =$?”)
- no value allowed (e.g., “$Water=\emptyset$”)

For example,

```
<table>
<thead>
<tr>
<th>Sky</th>
<th>AirTemp</th>
<th>Humid</th>
<th>Wind</th>
<th>Water</th>
<th>Forecast</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sunny</td>
<td>?</td>
<td>?</td>
<td>Strong</td>
<td>?</td>
<td>Same</td>
</tr>
</tbody>
</table>
```
Prototypical Concept Learning Task

- **Given:**
  - Instances $X$: Possible days, each described by the attributes \textit{Sky, AirTemp, Humidity, Wind, Water, Forecast}
  - Target function $c$: \textit{EnjoySport} : $X \rightarrow \{0, 1\}$
  - Hypotheses $H$: Conjunctions of literals. E.g.
    $$\langle ?, \text{Cold}, \text{High}, ?, ?, ? \rangle.$$  
  - Training examples $D$: Positive and negative examples of the target function
    $$\langle x_1, c(x_1) \rangle, \ldots \langle x_m, c(x_m) \rangle$$

- **Determine:** A hypothesis $h$ in $H$ such that $h(x) = c(x)$ for all $x$ in $D$. 
The inductive learning hypothesis: Any hypothesis found to approximate the target function well over a sufficiently large set of training examples will also approximate the target function well over other unobserved examples.
Instance, Hypotheses, and More-General-Than

Instances $X$

\[ x_1 = \langle \text{Sunny, Warm, High, Strong, Cool, Same} \rangle \]
\[ x_2 = \langle \text{Sunny, Warm, High, Light, Warm, Same} \rangle \]

Hypotheses $H$

\[ h_1 = \langle \text{Sunny, ?, ?, Strong, ?, ?} \rangle \]
\[ h_2 = \langle \text{Sunny, ?, ?, ?, ?, ?} \rangle \]
\[ h_3 = \langle \text{Sunny, ?, ?, ?, Cool, ?} \rangle \]
Find-S Algorithm

1. Initialize $h$ to the most specific hypothesis in $H$

2. For each positive training instance $x$
   - For each attribute constraint $a_i$ in $h$
     - If the constraint $a_i$ in $h$ is satisfied by $x$
       - Then do nothing
     - Else replace $a_i$ in $h$ by the next more general constraint that is satisfied by $x$

3. Output hypothesis $h$
Hypothesis Space Search by Find-S

Instances X

Hypotheses H

\[ x_1 = \langle \text{Sunny Warm Normal Strong Warm Same} \rangle, + \]
\[ x_2 = \langle \text{Sunny Warm High Strong Warm Same} \rangle, + \]
\[ x_3 = \langle \text{Rainy Cold High Strong Warm Change} \rangle, - \]
\[ x_4 = \langle \text{Sunny Warm High Strong Cool Change} \rangle, + \]

\[ h_0 = \langle \emptyset, \emptyset, \emptyset, \emptyset, \emptyset \rangle \]
\[ h_1 = \langle \text{Sunny Warm Normal Strong Warm Same} \rangle \]
\[ h_2 = \langle \text{Sunny Warm ? Strong Warm Same} \rangle \]
\[ h_3 = \langle \text{Sunny Warm ? Strong Warm Same} \rangle \]
\[ h_4 = \langle \text{Sunny Warm ? Strong ? ?} \rangle \]
Complaints about Find-S

- Can’t tell whether it has learned concept
- Can’t tell when training data inconsistent
- Picks a maximally specific $h$ (why?)
- Depending on $H$, there might be several!
Version Spaces

A hypothesis $h$ is **consistent** with a set of training examples $D$ of target concept $c$ if and only if $h(x) = c(x)$ for each training example $(x, c(x))$ in $D$.

$\text{Consistent}(h, D) \equiv (\forall (x, c(x)) \in D) \ h(x) = c(x)$

The **version space**, $V S_{H,D}$, with respect to hypothesis space $H$ and training examples $D$, is the subset of hypotheses from $H$ consistent with all training examples in $D$.

$$V S_{H,D} \equiv \{ h \in H | \text{Consistent}(h, D) \}$$
The List-Then-Eliminate Algorithm:

1. $VersionSpace \leftarrow$ a list containing every hypothesis in $H$

2. For each training example, $\langle x, c(x) \rangle$
   remove from $VersionSpace$ any hypothesis $h$ for which $h(x) \neq c(x)$

3. Output the list of hypotheses in $VersionSpace$
Example Version Space

$S$:  \{ \langle \text{Sunny, Warm, ?, Strong, ?, ?} \rangle \}

$G$:  \{ \langle \text{Sunny, ?, ?, ?} \rangle, \langle \text{?, Warm, ?, ?, ?} \rangle \}

Representing Version Spaces

The **General boundary**, \( G \), of version space \( VS_{H,D} \) is the set of its maximally general members.

The **Specific boundary**, \( S \), of version space \( VS_{H,D} \) is the set of its maximally specific members.

Every member of the version space lies between these boundaries

\[
VS_{H,D} = \{ h \in H | (\exists s \in S)(\exists g \in G)(g \geq h \geq s) \}
\]

where \( x \geq y \) means \( x \) is more general or equal to \( y \).
Candidate Elimination Algorithm

\(G \leftarrow\) maximally general hypotheses in \(H\)
\(S \leftarrow\) maximally specific hypotheses in \(H\)

For each training example \(d\), do

- If \(d\) is a positive example
  - Remove from \(G\) any hypothesis inconsistent with \(d\)
  - For each hypothesis \(s\) in \(S\) that is not consistent with \(d\)
    * Remove \(s\) from \(S\)
    * Add to \(S\) all minimal generalizations \(h\) of \(s\) such that
      1. \(h\) is consistent with \(d\), and
      2. some member of \(G\) is more general than \(h\)
    * Remove from \(S\) any hypothesis that is more general than another hypothesis in \(S\)

- If \(d\) is a negative example
- Remove from $S$ any hypothesis inconsistent with $d$
- For each hypothesis $g$ in $G$ that is not consistent with $d$
  * Remove $g$ from $G$
  * Add to $G$ all minimal specializations $h$ of $g$ such that
    1. $h$ is consistent with $d$, and
    2. some member of $S$ is more specific than $h$
  * Remove from $G$ any hypothesis that is less general than another hypothesis in $G$
Example Trace

$S_0 : \{<\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset>\}$

$G_0 : \{<?, ?, ?, ?, ?, ?>\}$
What Next Training Example?

S: \{ <Sunny, Warm, ?, Strong, ?, ?> \}

How Should These Be Classified?

\[ S: \{ <\text{Sunny}, \text{Warm}, ?, \text{Strong}, ?, ?> \} \]

\{\text{Sunny Warm Normal Strong Cool Change}\}

\{\text{Rainy Cool Normal Light Warm Same}\}

\{\text{Sunny Warm Normal Light Warm Same}\}

What Justifies this Inductive Leap?

+ \( \langle \text{Sunny Warm Normal Strong Cool Change} \rangle \)
+ \( \langle \text{Sunny Warm Normal Light Warm Same} \rangle \)

\[ S : \langle \text{Sunny Warm Normal ? ? ?} \rangle \]

Why believe we can classify the unseen
\( \langle \text{Sunny Warm Normal Strong Warm Same} \rangle \)
An UNBiased Learner

Idea: Choose $H$ that expresses every teachable concept (i.e., $H$ is the power set of $X$)

Consider $H' =$ disjunctions, conjunctions, negations over previous $H$. E.g.,

$$\langle Sunny \, Warm \, Normal \, ? \, ? \, ? \rangle \lor \neg \langle ? \, ? \, ? \, ? \, ? \, Change \rangle$$

What are $S$, $G$ in this case?

$S \leftarrow$

$G \leftarrow$
Inductive Bias

Consider

- concept learning algorithm $L$
- instances $X$, target concept $c$
- training examples $D_c = \{(x, c(x))\}$
- let $L(x_i, D_c)$ denote the classification assigned to the instance $x_i$ by $L$ after training on data $D_c$.

**Definition:**

The **inductive bias** of $L$ is any minimal set of assertions $B$ such that for any target concept $c$ and corresponding training examples $D_c$

$$(\forall x_i \in X)[(B \land D_c \land x_i) \vdash L(x_i, D_c)]$$

where $A \vdash B$ means $A$ logically entails $B$
Inductive Systems and Equivalent Deductive Systems

Inductive system

Training examples

New instance

Candidate
Elimination
Algorithm

Using Hypothesis Space \( H \)

Classification of new instance, or "don’t know"

Equivalent deductive system

Training examples

New instance

Assertion "\( H \) contains the target concept"

Theorem Prover

Classification of new instance, or "don’t know"

Inductive bias made explicit
Three Learners with Different Biases

1. *Rote learner*: Store examples, Classify $x$ iff it matches previously observed example.
2. *Version space candidate elimination algorithm*
3. *Find-S*
Summary Points

1. Concept learning as search through $H$
2. General-to-specific ordering over $H$
3. Version space candidate elimination algorithm
4. $S$ and $G$ boundaries characterize learner’s uncertainty
5. Learner can generate useful queries
6. Inductive leaps possible only if learner is biased
7. Inductive learners can be modelled by equivalent deductive systems
